Cross-Reference to Related Applications

5 This application is a continuation-in-part of copending application Serial No.

Technical Field

10 This invention relates to compounds having pharmacological activity, to
pharmaceutical compositions containing such compounds and to medical methods of
treatment. More particularly, the present invention concerns certain substituted indole
urea, oxime, acetamide and hydroxamic acid compounds, pharmaceutical
compositions containing the compounds, and to a method of treating disease states
which involve leukotrienes and other metabolic products resulting from the action of
15 5-lipoxygenase on arachidonic acid.

Background of the Invention

20 5-Lipoxygenase is the first dedicated enzyme in the pathway leading to the
biosynthesis of leukotrienes. This important enzyme has a rather restricted
distribution, being found predominantly in leukocytes and mast cells of most
mammals. Normally 5-lipoxygenase is present in the cell in an inactive form;
however, when leukocytes respond to external stimuli, intracellular 5-lipoxygenase
can be rapidly activated. This enzyme catalyzes the addition of molecular oxygen to
fatty acids with *cis,cis*-1,4-pentadiene structures, converting them to 1-hydroperoxy-
25 *trans,cis*-2,4-pentadienes. Arachidonic acid, the 5-lipoxygenase substrate which
leads to leukotriene products, is found in very low concentrations in mammalian cells
and must first be hydrolyzed from membrane phospholipids through the actions of
phospholipases in response to extracellular stimuli. The initial product of 5-
lipoxygenase action on arachidonate is 5-hydroperoxyeicosatetraenoic acid (5-
30 HPETE) which can be reduced to 5-hydroxyeicosatetraenoic acid (5-HETE) or
converted to leukotriene A₄ (LTA₄). This reactive leukotriene intermediate is
enzymatically hydrated to leukotriene B₄ (LTB₄) or conjugated to the tripeptide,
glutathione, to produce leukotriene C₄ (LTC₄). LTA₄ can also be hydrolyzed
nonenzymatically to form two isomers of LTB₄. Successive proteolytic cleavage
35 steps convert LTC₄ to leukotrienes D₄ and E₄ (LTD₄ and LTE₄). Other products
resulting from further oxygenation steps have also been described in the literature.
Products of the 5-lipoxygenase cascade are extremely potent substances which

produce a wide variety of biological effects, often in the nanomolar to picomolar concentration range.

The remarkable potencies and diversity of actions of products of the 5-lipoxygenase pathway have led to the suggestion that they play important roles in a variety of diseases. Alterations in leukotriene metabolism have been demonstrated in a number of disease states including asthma, allergic rhinitis, rheumatoid arthritis, gout, psoriasis, adult respiratory distress syndrome, inflammatory bowel disease, endotoxin shock syndrome, atherosclerosis, ischemia induced myocardial injury, and central nervous system pathology resulting from the formation of leukotrienes following stroke or subarachnoid hemorrhage.

The enzyme 5-lipoxygenase catalyzes the first step leading to the biosynthesis of all the leukotrienes and therefore inhibition of this enzyme provides an approach to limit the effects of all the products of this pathway. Compounds which inhibit 5-lipoxygenase are thus useful in the treatment of disease states such as those listed above in which the leukotrienes play an important role.

Certain compounds of this invention may exist in geometric or stereoisomeric forms. The present invention contemplates all such compounds, including *cis*- and *trans*- geometric isomers, R- and S-enantiomers, diastereomers, and mixtures thereof as falling within the scope of the invention. If a particular enantiomer is desired, it may be prepared by chiral synthesis or by derivatization with a chiral auxiliary where the resulting diastereomeric mixture is separated and the auxiliary group cleaved to provide the pure desired enantiomers. Alternatively, where the molecule contains a basic functional group such as amino or an acidic functional group such as carboxyl, diastereomeric salts are formed with an appropriate optically active acid or base, followed by resolution of the diastereomers thus formed by fractional crystallization

or chromatographic means well known in the art and subsequent recovery of the pure enantiomers.

5 Certain compounds of the present invention may contain a basic functional group such as amino, alkylamino, or dialkylamino and are thus capable of forming salts with pharmaceutically acceptable acids. The term "pharmaceutically acceptable salts" in this respect, refers to the relatively non-toxic, inorganic and organic acid addition salts of compounds of the present invention. These salts can be prepared *in situ* during the final isolation and purification of the compounds or by separately reacting the purified compound in its free base form with a suitable organic or
10 inorganic acid and isolating the salt thus formed. Representative salts include the hydrobromide, hydrochloride, sulfate, bisulfate, phosphate, nitrate, acetate, oxalate, valerate, oleate, palmitate, stearate, laurate, borate, benzoate, lactate, phosphate, tosylate, citrate, maleate, fumarate, succinate, tartrate, naphthylate, mesylate, glucoheptonate, lactobionate, laurylsulphonate salts and the like. (See, for example S. M. Berge, et al., "Pharmaceutical Salts," J. Pharm. Sci., 66: 1-19 (1977) which is
15 incorporated herein by reference.)

In other cases, the compounds may contain one or more acidic functional groups such as carboxyl and the like and are capable of forming salts with pharmaceutically acceptable bases. The term "pharmaceutically acceptable salts" in
20 these instances refers to the relatively non-toxic, inorganic and organic base addition salts of compounds of the present invention. These salts can be likewise prepared *in situ* during the final isolation and purification of the compounds or by separately reacting the purified compound in its free acid form with a suitable base such as the hydroxide, carbonate or bicarbonate of a pharmaceutically acceptable metal cation or
25 with ammonia, or an organic primary, secondary, or tertiary amine. Representative alkali or alkaline earth salts include the lithium, sodium, potassium, calcium, magnesium and aluminum salts and the like. Representative organic amines useful for the formation of base addition salts include ethylamine, diethylamine, ethylenediamine, ethanolamine, diethanolamine, piperazine, and the like. (See, for
30 example S. M. Berge, et al., "Pharmaceutical Salts," J. Pharm. Sci., 66: 1-19 (1977) which is incorporated herein by reference.)

Synthesis of the Compounds

The compounds of the present invention are synthesized by the following
35 general synthetic routes. One general method for the synthesis of intermediate indoles used to prepare compounds of this invention, shown in Reaction Scheme 1,

employs the Fischer indole synthesis (cf. Advanced Organic Chemistry, Reactions, Mechanisms, and Structure, 3rd Ed. by J. March, John Wiley and Sons, 1985, p. 1032). In this method a hydrazine I is reacted with ketone II in a suitable solvent at a temperature between 20°C and the refluxing temperature of the chosen solvent to provide the indole product III. The intermediate indole III is subsequently transformed by the procedures described for individual examples to provide the final products of this invention.

Reaction Scheme 1

Another general method illustrated in Reaction Scheme 2, involves the reaction of hydrazine intermediate IV with the ketone intermediate V to provide the indole intermediate VI. The intermediate VI is then treated under basic conditions with a halogenated alkylaryl compound VII, where aryl is a heteroaryl group such as furanyl, thienyl, pyridyl, pyrimidyl, thiazoyl, benzothiazoyl, benzothiophenyl, benzofuranyl, or substituted phenyl.

Inhibition of Leukotriene Biosynthesis *In Vitro*

Inhibition of leukotriene biosynthesis by representative compounds of the present invention was evaluated in assays involving calcium ionophore-induced LTB₄ biosynthesis expressed by human polymorphonuclear leukocytes (PMNL) or human whole blood. Human PMNL were isolated from heparinized (20 USP units/mL) venous blood using Ficoll-Hypaque Mono-Poly Resolving Medium. Human PMNL suspensions (5 x 10⁶ cells/250 µL) were preincubated with test compounds or vehicle for 15 min at 37 °C followed by calcium ionophore A23187 challenge (final concentration of 8.3 µM) and the reaction terminated after 10 min by adding two volumes of methanol containing prostaglandin B₂ as an internal recovery standard. The methanol extracts were analyzed for LTB₄ content by HPLC or radioimmunoassay.

The assay using human heparinized whole blood was incubated for 30 minutes at 37 °C after adding 50 µM of ionophore A23187. The plasma layer was obtained by centrifugation and deproteinized by the addition of four volumes of methanol. The methanol extract was analyzed for LTB₄ by HPLC or radioimmunoassay.

The inhibitory activity of representative examples is shown in Table 1.

Inhibition of Leukotriene Biosynthesis *In Vivo*

25

Inhibition of the biosynthesis of leukotrienes *in vivo* after oral administration of compound was determined using a rat peritoneal anaphylaxis model in a similar manner as that described by Young and coworkers (Young, P. R.; Dyer, R.D.; Carter, G. W. *Fed. Proc., Fed. Am. Soc. Exp. Biol.* **1985**, *44*, 1185). In this model rats were injected intraperitoneally (ip) with rabbit antibody to bovine serum albumin (BSA) and three hours later injected ip with BSA to induce an antigen-antibody response. Rats were sacrificed 15 minutes after this challenge and the peritoneal fluids were collected and analyzed for leukotriene levels. Test compounds were administered by gavage one hour prior to the antigen challenge. Percent inhibition values were determined by comparing the treatment group to the mean of the control group. Compounds of this invention are orally effective in preventing the *in vivo* biosynthesis of leukotrienes as illustrated for representative examples shown in Table 2.

Pharmaceutical Compositions

15 The present invention also provides pharmaceutical compositions which comprise one or more of the compounds of formula I above formulated together with one or more non-toxic pharmaceutically acceptable carriers. The pharmaceutical compositions may be specially formulated for oral administration in solid or liquid form, for parenteral injection, or for rectal or vaginal administration.

20 The pharmaceutical compositions of this invention can be administered to humans and other animals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments, or drops), buccally, or as an oral or nasal spray. The term "parenteral" administration as used herein refers to modes of administration which include intravenous, intramuscular, 25 intraperitoneal, intrasternal, subcutaneous and intraarticular injection and infusion.

30 Pharmaceutical compositions of this invention for parenteral injection comprise pharmaceutically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions as well as sterile powders for reconstitution into sterile injectable solutions or dispersions just prior to use. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyols (such as glycerol, propylene glycol, polyethylene glycol, and the like), and suitable mixtures thereof, vegetable oils (such as olive oil), and injectable organic esters such as ethyl oleate. Proper fluidity can be maintained, for example, by the use of coating materials such as lecithin, by the maintenance of the required 35 particle size in the case of dispersions, and by the use of surfactants.

These compositions may also contain adjuvants such as preservative, wetting agents, emulsifying agents, and dispersing agents. Prevention of the action of microorganisms may be ensured by the inclusion of various antibacterial and antifungal agents, for example, paraben, chlorobutanol, phenol sorbic acid, and the like. It may also be desirable to include isotonic agents such as sugars, sodium chloride, and the like. Prolonged absorption of the injectable pharmaceutical form may be brought about by the inclusion of agents which delay absorption such as aluminum monostearate and gelatin.

In some cases, in order to prolong the effect of the drug, it is desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution which, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle.

Injectable depot forms are made by forming microencapsule matrices of the drug in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissues.

The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium just prior to use.

Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically acceptable excipient or carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid, b) binders such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidone, sucrose, and acacia, c) humectants such as glycerol, d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, e) solution retarding agents such as paraffin, f) absorption accelerators such as quaternary ammonium compounds, g) wetting agents such as, for example,

cetyl alcohol and glycerol monostearate, h) absorbents such as kaolin and bentonite clay, and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

5 Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

10 The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions which can be used include polymeric substances and waxes.

15 The active compounds can also be in micro-encapsulated form, if appropriate, with one or more of the above-mentioned excipients.

20 Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethyl formamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof.

25 Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

30 Suspensions, in addition to the active compounds, may contain suspending agents as, for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar, and tragacanth, and mixtures thereof.

35 Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a

suppository wax which are solid at room temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

Dosage forms for topical administration of a compound of this invention include powders, sprays, ointments and inhalants. The active compound is mixed under sterile conditions with a pharmaceutically acceptable carrier and any needed
5 preservatives, buffers, or propellants which may be required. Ophthalmic formulations, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

Actual dosage levels of active ingredients in the pharmaceutical compositions of this invention may be varied so as to obtain an amount of the active compound(s)
10 that is effective to achieve the desired therapeutic response for a particular patient, compositions, and mode of administration. The selected dosage level will depend upon the activity of the particular compound, the route of administration, the severity of the condition being treated, and the condition and prior medical history of the
15 patient being treated. However, it is within the skill of the art to start doses of the compound at levels lower than required for to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

Generally dosage levels of about 1 to about 50, more preferably of about 5 to about 20 mg of active compound per kilogram of body weight per day are
20 administered orally to a mammalian patient. If desired, the effective daily dose may be divided into multiple doses for purposes of administration, e.g. two to four separate doses per day.

The following examples are presented to enable one skilled in the art to practice the present invention. These examples are merely illustrative and should not
25 be read as limiting the invention as it is defined by the appended claims.

This solution was poured into a separatory funnel containing hexanes. The layers were separated, and the aqueous back extracted with ether. The organic layers were combined, washed (1 x sat'd, aq NaHCO₃; 1 x H₂O; and 3 x brine), dried (MgSO₄), and concentrated *in vacuo* to yield 1.16 g of a yellow, amorphous solid aldehyde intermediate 2.2.

10 To a solution of ethyl bromopyruvate (10.00 g, 51.3 mmol) in THF (250 mL) at 0°C, was added 2-methyl-2-propanethiol (4.86 g, 53.87 mmol) followed by the dropwise addition of triethylamine (6.22 g, 61.56 mmol). The cooling bath was removed and the reaction allowed to come to rt and stir for 15 h. The reaction was then diluted with brine (250 mL) and extracted with ethyl acetate (3x 250 mL). The organics were combined, dried with MgSO₄ and concentrated. Vacuum distillation of the resulting residue (0.7 mm Hg) afforded 6.47 g (62%) of ethyl t-butylthiopyruvate as a colorless oil (b.p.89-92°C) which was used immediately.

20 To a solution of ethyl t-butylpyruvate (6.46 g, 31.7 mmol) in toluene (120 mL) was added N-(4-isopropylphenyl)-N-(4-chlorobenzyl)-hydrazine (11.43 g, 36.7 mmol), sodium acetate (3.30 g, 40.26 mmol) and acetic acid (60 mL). The reaction was stirred for 24 h in the dark. It was then diluted with brine (200 mL) and extracted with ethyl acetate (3x 200 mL). The organics were combined, dried with MgSO₄ and concentrated. The resulting residue was chromatographed (silica gel, ether:hexanes, 2:98) to afford 7.53 g (46%) of intermediate 14.1.

To a solution of intermediate 14.1 (7.51 g, 16.91 mmol) in toluene (25 mL) at -78°C, was added diisobutylaluminum hydride (50.73 mL of a 1.0 M solution in hexanes, 50.73 mmol) dropwise. Upon completion of addition, the reaction was stirred for 30 min at -78°C. It was then quenched with aqueous 10% HCl (75 mL) and warmed to rt and extracted with ethyl acetate (3x 75 mL). The organics were combined, dried with MgSO₄ and concentrated. The unpurified residue was taken up in CH₂Cl₂ (80 mL) and pyridinium dichromate (9.54 g, 25.37 mmol) was added. The reaction was stirred for 15 h, then filtered through Celite. The filtrate was concentrated. The resulting residue was chromatographed (silica gel, ether:hexanes, 3:97) to afford 4.16 g (61% over the two steps) of intermediate 14.2 as an off-white solid.

A solution of intermediate 14.2 (4.15 g, 10.4 mmol) and malonic acid (1.40 g, 13.5 mmol) in pyridine (5 mL) containing piperidine (177 mg, 2.08 mmol) was refluxed for 18 h. It was then cooled to rt and poured into ice/conc. HCl (50 mL). This aqueous solution was then extracted with ethyl acetate (3x 50 mL). The organics were combined, dried with MgSO₄ and concentrated. The resulting residue was chromatographed (silica gel, ether:hexanes:acetic acid, 30:69:1) to afford 1.06 g (23%) of intermediate 14.3 as a gold foam.

To a solution of intermediate 14.3 (1.05 g, 2.4 mmol) in CH₂Cl₂ (10 mL) was added oxalyl chloride (362 mg, 2.9 mmol) followed by a drop of N,N-dimethylformamide. The reaction was stirred for 1 hr, then concentrated. The resulting residue was taken up in CH₂Cl₂ (10 mL) and cooled to 0°C. N,O-Dimethylhydroxylamine hydrochloride (283 mg, 2.9 mmol) was added followed by pyridine (456 mg, 5.76 mmol). The cooling bath was withdrawn and the reaction allowed to warm to rt, diluted with brine (10 mL), and the layers were separated. The aqueous layer was extracted with CH₂Cl₂ (2x 10 mL). The organics were combined, dried with MgSO₄ and concentrated. The resulting residue was chromatographed (silica gel, ether:hexanes, 1:1) to afford 1.04 g (89%) of intermediate 14.4 as a brown oil.

To a suspension of trimethylsulfoxonium iodide (514 mg, 2.3 mmol) in DMSO (5 mL) was added sodium hydride (57 mg of 97% dry, 2.3 mmol) and the resulting mixture was stirred for 20 min. Intermediate 14.4 (1.03 g, 2.1 mmol) was then added dropwise as a solution in DMSO (5 mL) and the reaction was stirred for 2 h at rt then brought to 50°C for 18 h. It was then cooled to rt and diluted with brine (15 mL). This aqueous solution was extracted with ethyl acetate (3x 20 mL). The organics were combined, dried with MgSO₄ and concentrated. The resulting residue was

chromatographed (silica gel, ether:hexanes, 25:75) to afford intermediate 972 mg (93%) of intermediate 14.7 as a colorless oil.

Upon complete addition, the reaction was stirred for 30 min. It was then diluted with 10% aqueous HCl (10 mL) and extracted with ethyl acetate (3x 10 mL). The organics were combined, dried with MgSO₄ and concentrated. The resulting residue was chromatographed (silica gel, ether:hexanes, 15:85) to afford 349 mg (41%) of intermediate 14.8 along with 372 mg (44%) of intermediate 14.9.

Intermediate 14.9 (362 mg, 0.819 mmol) was recycled to intermediate 14.8 (218 mg, 61%) following the oxidation procedure described for the conversion of 2.1 to 2.2.

A solution of intermediate 14.8 (567 mg, 1.29 mmol) in 1:1 ethanol:pyridine (6 mL) was stirred for 18 h and concentrated. The resulting residue was taken up in brine (5 mL) and extracted with ethyl acetate (3x 5 mL). The organics were combined, dried with MgSO₄ and concentrated to afford intermediate 14.10.

288

A solution of 4-acetamidophenol (14.28g, 94.4 mmol), 2-(chloromethyl)quinoline monohydrochloride (20.22 g, 94.4 mmol) and freshly powdered K₂CO₃ (39.14 g, 283.2 mmol) in DMF (250 mls) for 4 days. It was then poured into 1:1 ice:H₂O (600 mls). The resulting precipitate was collected and washed with water. It was then crystallized in 95% ethanol to afford 25.31 g (91%) of 4-(quinolin-2-ylmethoxy)acetanilide.

A suspension of 4-(quinolin-2-ylmethoxy)acetanilide (25.29 g, 86.6 mmol) in 95% ethanol (200 mls) containing 10 M KOH (25 mls) was heated at reflux for 3 days. It was then cooled to r.t. and the ethanol was stripped off *in vacuo*. The resulting residue was diluted with water (40 mls) and the precipitate collected and washed well with water. It was then taken up in hot ethylacetate (500 mls) and decolorized with charcoal. The solution was boiled to leave a volume of 200 mls, and

hexane was added (200 mls). The solution was allowed to cool to r.t. and the crystals collected to afford 16.63 g (77%) of 4-(quinolin-2-ylmethoxy)aniline.

To a suspension of 4-(quinolin-2-ylmethoxy)aniline (10.62 g, 42.5 mmol) in H₂O (40 mls) was added concentrated HCl (10.63 mls, 127.5 mmol) and the suspension was vigorously stirred to obtain a fine white suspension, then cooled to 0°C. A solution of sodium nitrite (3.02 g, 43.78 mmol) in H₂O (9 mls) was then added dropwise. Upon completion of addition, the reaction was stirred for 1 hr at 0°C to afford the diazonium salt as a clear orange/yellow solution.

To a solution of Na₂S₂O₄ (56.20 g of an 85% purity sample, 274.35 mmol) in water (250 mls), and ether (250 mls) containing NaOH (1.90 mls of a 2N solution, 3.79 mmol) at 0°C, was added the solution of the diazonium salt from above, dropwise and with vigorous stirring. Upon completion of addition, NaOH (75.89 mls of a 2N solution, 151.8 mmol) was added dropwise. The cooling bath was removed and the reaction allowed to warm to r.t. and stirred for 1 hr. The orange solid was then collected, washed well with ether and finally with water. The resulting solid was freeze dried for 18 hrs to afford 9.84 g (87%) of 4-(quinolin-2-ylmethoxy)phenylhydrazine as a pale orange solid.

To a solution of diisopropylethylamine (7.67 g, 59.36 mmol) in CH₂Cl₂ (150 mls) was added 4-(quinolin-2-ylmethoxy)phenylhydrazine (9.83 g, 37.1 mmol). This was followed by the addition of 4-chlorobenzyl chloride (8.96 g, 55.65 mmol), tetrabutylammonium bromide (3.59 g, 11.13 mmol) and an additional 50 mls of CH₂Cl₂ and the reaction was stirred for 24 hrs. It was then diluted with H₂O (200 mls) and the layers were separated. The aqueous was extracted with CH₂Cl₂ (2x 200 mls). the organics were combined, dried with MgSO₄ and concentrated. The resulting solid was washed with 9:1 ether:methanol (250 mls) to afford 8.89 g (64%) of 1-(4-chlorophenylmethyl)-1-(4-(quinolin-2-ylmethoxy)phenyl)hydrazine as a pale yellow solid.

To a solution of methyl 2,2-dimethyl-4-keto-5-(1,1-dimethylethylthio)pentenoate (5.29 g, 21.5 mmol) in toluene (50 mls) and acetic acid (25 mls) was added sodium acetate (2.03 g, 24.73 mmol) followed by 1-(4-chlorophenylmethyl)-1-(4-(quinolin-2-ylmethoxy)phenyl)hydrazine (8.88 g, 22.8 mmol) and the reaction was stirred for 5 days in the dark. It was then poured into water (500 mls) and extracted with ethylacetate (3x 100 mls). The combined organics were then washed with water (3 x 100 mls). Solid NaHCO₃ (10 g) was added to the organics and the mixture was filtered and finally washed with water (2x 100 mls). It was then dried with MgSO₄ and concentrated. The resulting residue was

chromatographed (silica gel, ether:hexanes, 2:8 to 3:7) to afford methyl 3-[3-(1,1-dimethylethylthio)-5-(quinolin-2-ylmethoxy)-1-(4-chlorophenylmethyl)indol-2-yl]-2,2-dimethylpropionate.

It was then cooled to r.t., diluted with water (50 mls) and washed with ether (1x 60 mls). The aqueous layer was then acidified to pH5 by the addition of solid citric acid and extracted with ethylacetate (3x 60 mls). The organics were combined, dried with
10 MgSO₄, decolorized with charcoal and concentrated. Crystallization in ethylacetate/hexanes afforded 3-[3-(1,1-dimethylethylthio)-5-(quinolin-2-ylmethoxy)-1-(4-chlorophenylmethyl)indol-2-yl]-2,2-dimethylpropionic acid.

To a solution of 3-[3-(1,1-dimethylethylthio)-5-(quinolin-2-ylmethoxy)-1-(4-chlorophenylmethyl)indol-2-yl]-2,2-dimethylpropionic acid (2.57 g, 4.4 mmol) in
15 THF (20 mls) was added borane dimethyl sulfide complex (1.06 g, 14.0 mmol) dropwise. Upon completion of addition, the reaction was stirred for 18 hrs. It was then quenched slowly and dropwise with aqueous sat'd NaHCO₃ (30 mls). The THF was stripped off *in vacuo* and the aqueous residue was extracted with ethylacetate (3x 50 mls). The organics were combined, dried with MgSO₄ and concentrated. The
20 resulting residue was chromatographed (silica gel, ether:hexanes, 1:1) to afford 1.82 g (72%) of 3-[3-(1,1-dimethylethylthio)-5-(quinolin-2-ylmethoxy)-1-(4-chlorophenylmethyl)indol-2-yl]-2,2-dimethylpropanol as a white foam.

To a solution of oxalyl chloride (461 mg, 3.6 mmol) in CH₂Cl₂ (10 mls) at -78°C was added dimethylsulfoxide (600 mg, 7.68 mmol) dropwise and the resulting

Triethylamine (1.62 g, 16.0 mmol) was then added dropwise, the cooling bath was withdrawn and the reaction allowed to warm to r.t. It
30 was then diluted with aqueous sat'd NaHCO₃ (20 mls) and the layers were separated. The aqueous was extracted with CH₂Cl₂ (2x 20 mls). The organics were combined, dried with MgSO₄ and concentrated. The resulting residue was chromatographed (silica gel, ether:hexanes, 1:1) to afford 1.58 g (86%) of 3-[3-(1,1-dimethylethylthio)-5-(quinolin-2-ylmethoxy)-1-(4-chlorophenylmethyl)indol-2-yl]-2,2-
